Hope in a decaying society Von Paul Kaline Wars of independence and loss of morale are sapping the human galactic empire, and the decay seems unstoppable. One of the poorer colony planets has scrapped together enough money to send a student to Terra with the hope that he will bring back information about a half-mythical supercomputer hidden

somewhere on the planet during a recent colonial war. According to its believers this computer will tell the colonists what they must do to bring back success to their planet. The story is mostly a - fast-paced - human and social adventure in a society with many questions and little hope. The author has few illusions about society yet shows a strong ethical yearning and a very healthy optimism, which makes for interesting and pleasant reading.
